The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Registration under the Companies Act does not constitute a new legal entity but merely affects the company to certain additional company law rules.

Signed

Dated 26 November 2003

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be notified if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you have any questions, please contact the Patent Office on 08459 500005.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

Ebac Limited

## **RESERVOIRS FOR BOTTLED LIQUID DISPENSERS**

---

### **TECHNICAL FIELD OF THE INVENTION**

This invention relates to bottled liquid dispensers.

### **BACKGROUND**

EP 0 581 491 A discloses a known form of bottled liquid dispenser in which a liquid (usually water) is supplied from a bottle to hot and cold discharge outlets via respective reservoirs. The cold reservoir of such a dispenser normally includes an outer casing of foamed heat insulating material, with cooling coils interposed between the insulation material and the wall of the reservoir. The hot reservoir contains an electrical heating element, and this too is commonly held in a casing of heat insulating foam to reduce heat loss.

There is a general trend towards reducing the volume of bottled liquid dispensers so that they occupy less space. On the other hand, the volume of the reservoirs should generally be as large as possible to maximise the volume of hot or cold liquid which can be dispensed without having to wait for the temperature to re-stabilise.

The present invention seeks to provide a new and inventive form of bottled liquid dispenser which allows the volume of the dispenser to be minimised whilst maximising the internal liquid-containing space within the respective reservoir.

### SUMMARY OF THE INVENTION

The present invention provides a bottled liquid dispenser in which liquid is supplied from a bottle to a discharge outlet via a reservoir containing a liquid space, wherein the reservoir is provided with thermal means and includes an inner wall and an outer wall defining a sealed and evacuated heat-insulating cavity at least partially surrounding the liquid space.

In one application of the invention the reservoir takes the form of a cooling vessel with the thermal means provided by a cooling coil. The invention may also be applied to reservoirs which form a hot tank with the thermal means provided by a heating element.

### DEFINITIONS

It will be appreciated that terms such as "evacuated" and "vacuum" as used herein are intended to have their common meanings which pertain to a substantially reduced internal pressure rather than a total or absolute vacuum.

## BRIEF DESCRIPTION OF THE DRAWINGS

The following description and the accompanying drawings referred to therein are included by way of non-limiting example in order to illustrate how the invention may be put into practice. In the drawings;

Figure 1 is a general vertical section through a bottled water dispenser in accordance with the invention;

Figure 2 is a vertical sectional view showing a first form of cold reservoir which may be used in the dispenser;

Figures 3 and 4 are vertical and horizontal sectional views showing another form of cold reservoir which may be used in the dispenser;

Figures 5 to 8 are vertical sectional views showing various alternative forms of cold reservoir; and

Figures 9 and 10 are vertical sectional views showing two forms of hot tank which may be used in the dispenser.

## DETAILED DESCRIPTION OF THE DRAWINGS

Fig. 1 shows a bottled water dispenser having a housing 1 with a dispensing recess 2 formed in its front wall. The top wall of the housing is formed with an annular seat 3 for supporting an inverted bottle 4 having a depending

neck 5 which is received within a collar portion 6. A feed tube unit 7 is removably mounted below the collar portion 6 to conduct liquid from the bottle 4 via a flexible tube 8 to a cold reservoir 9 within the housing. A dip tube 10 conducts cooled liquid from the reservoir via an outlet tube 11 to a cold discharge valve 12 at the top of the recess 2. A second flexible tube 13 may be provided to conduct liquid from the feed tube unit 7 to a replaceable hot tank 14 so that hot water may be dispensed via a second outlet tube 15 and hot discharge valve 16 mounted alongside the cold valve 12.

Fig. 2 shows a first form of the cold water reservoir 9, which may be fixed within the dispenser or provided as a replaceable unit which can be replaced periodically together with the feed tube unit 7 and associated tubes. The reservoir has sides 20 and a bottom 21 defining an internal fluid space 22, with spaced inner and outer walls 23 and 24 which are welded together at their upper ends to form an air-tight seal 25. An intermediate wall 26 is roll-bonded to the inner wall 23 to form a coiled duct 27 through which coolant fluid may be conducted between a first connection 28 and a second connection 29, both passing through the outer wall 24. The remaining cavity 30 between the inner and outer walls is evacuated to create a heat insulating space which surrounds the internal fluid space 22. The tubes 8 and 11 and the dip tube 10 are connected to a heat-insulating cap 31 which may, for example, be formed of foamed plastics material or evacuated inner and outer walls similar to the reservoir body.

Figs 3 and 4 show another form of the cold water reservoir 9, which again, may be fixed or replaceable. Again, the reservoir has sides 20 and a bottom 21 formed by spaced inner and outer walls 23 and 24 sealed at their upper ends 25. The cavity 30 between the inner and outer walls is evacuated to

create a heat insulating space surrounding the fluid space 22. In this embodiment a coiled refrigerant tube 37 is secured to the inner wall 23 within the upper portion of the fluid space 22. A vertical channel 38 is formed in the inner wall 23 to carry a capillary tube 39 which is connected to one end of the coil 37 and an optional temperature probe 40 for thermostatic temperature control of the reservoir contents. The reservoir may again be provided with a heat-insulating cap (not shown).

The cold reservoirs of Figs. 5 and 6 are similar to the reservoir of Figs. 3 and 4 except as follows. In Fig. 5 the capillary feed tube 39 and thermocouple probe 40 are routed helically between the turns of the heat exchanger coil 37. In Fig. 6 the refrigerant connection 42 to the coil 37 passes through an sealed aperture 44 in the inner and outer walls 23 and 24. The temperature probe 40 may similarly be inserted through a sealed aperture 46.

The cold reservoir which is shown in Fig. 7 may be fixed or replaceable. The sides 20 are formed by spaced inner and outer walls 23 and 24 sealed at their upper and lower ends 25 and 45. A separate bottom 21, which may, for example, be formed of foamed plastics material or evacuated inner and outer walls, is sealingly joined to the lower end of the sides 20. The cavity 30 between the two walls 23 and 24 is evacuated to create a heat insulating space surrounding the fluid space 22. A coiled refrigerant tube 37 is secured to the inner wall 23 within the upper portion of the fluid space 22, but in this case the lower connection 42 passes through the junction between the bottom 21 and the sides 20. A thermostat probe 40 may also be sealingly inserted between the bottom and side components. The

reservoir may again be provided with a heat-insulating cap 31 as described.

Fig. 8 shows another fixed or replaceable cold water reservoir 9 having sides 20 and an annular bottom 21 formed by spaced inner and outer walls 23 and 24 sealed at their upper ends 25 to form an intermediate evacuated space 30. In addition, the fluid space 22 within the side walls 20 contains an internal wall 50 which is closed by an upper end wall 51. The lower end of the internal wall is open and joins the inner margin of the annular bottom wall 21 forming a cavity 52 to receive the cooling coil 37. The reservoir may again be provided with a heat-insulating cap 31.

Fig. 9 shows a first form of the hot tank 14 which may be fixed within the dispenser or provided as a replaceable unit which can be replaced at intervals together with the feed tube unit 7 and associated tubes. The hot tank has sides 20 and a bottom 21 defining an internal fluid space 22, with spaced inner and outer walls 23 and 24 which are welded together at their upper ends to form an air-tight seal 25. The cavity 30 between the inner and outer walls is evacuated to create a heat insulating space which surrounds the internal fluid space 22. The water inlet tube 13 is connected to an inlet tube 60 which extends to the bottom of the space 22. The tube 60 is mounted in a heat-insulating cap 31 which may include evacuated inner and outer walls similar to the reservoir body. Alternatively the cap may contain foamed heat insulation material. In this example the cap 31 is secured to the reservoir side wall 20 by complementary screw threads 61 and 62. The cap has a hot water inlet aperture 63 for connection with the outlet tube 15, and an electrical heating element 65 projects into the liquid space 22. A temperature probe 40 may be inserted through the cap for temperature control. In order to prevent a buildup of pressure within the hot tank 14 a

steam vent 67 may be provided, sealable by a float valve 68. Alternative forms of steam vent may be used such as an auxiliary port at the top of the inlet tube 60.

Fig. 10 shows another form of fixed or replaceable hot tank 14. The hot tank has sides 20 surrounding an internal fluid space 22, with spaced inner and outer walls 23 and 24 which are welded together at their upper and lower ends to form an air-tight seals 25 and 45. The cavity 30 between the inner and outer walls is evacuated to create a heat insulating space. The hot tank has heat-insulated top and bottom caps 31 and 21 which may include evacuated inner and outer walls or foamed heat insulation material. The water inlet tube 13 is connected to an inlet aperture 60 mounted in the bottom cap 21 while the top cap 31 has a hot water outlet aperture 63 for connection with the outlet tube 15. An electrical heating element 65 is also mounted in the bottom cap 21 to project into the liquid space 22 and a temperature probe 40 may also be inserted through the bottom cap for temperature control. To avoid a buildup of excess pressure within the hot tank 14 a steam vent 67 may be provided in the top cap 31 sealable by a float valve 68. Alternative forms of steam vent may again be provided.

The reservoirs described herein may be formed of metal (copper, aluminium etc.), plastic or glass for example. Moreover, they could be of any convenient transverse cross-sectional shape, e.g. oval or rectangular rather than round.

The caps 31 could be secured to the reservoir by bayonet fitting, screw threads etc, with or without an O-ring seal. The bottom caps 21 of Figs 7 and 10 could likewise be secured in a similar manner.

The reservoirs occupy significantly less space than a reservoir formed with conventional insulation materials, an 8mm vacuum insulating wall being approximately equivalent to a 20mm thick wall of foamed plastic. The fluid capacity of the reservoir may be maximised within a given space and the performance of the water dispenser is increased by reducing energy consumption and reducing the time required to achieve the desired water temperature.

It will be appreciated that the features disclosed herein may be present in any feasible combination. Whilst the above description lays emphasis on those areas which, in combination, are believed to be new, protection is claimed for any inventive combination of the features disclosed herein.
